Abstract of the Disclosure

A tool try-on device includes a body and a frictional retaining member
mounted to the body. The frictional retaining member and the body together
define a compartment for receiving a rotatable member rotatably mounted to an
end of a handle of a tool. The frictional retaining member exerts a frictional force
to an outer surface of the rotatable member of the tool for retaining the rotatable
member in place unless a rotational force greater than the frictional force is
applied to the handle of the tool in a ratcheting direction.
